

I'm taking many things away from what I learned in IFSC-3342. I walked into the class wondering why I didn't take it earlier honestly (it would've helped a lot in IT-TOPAZ). I had gotten the basics and a bit of the complexities down at that point—yet I wasn't completely familiar with making a responsive website with multiple breakpoints.

The idea of progressive enhancement is what makes building websites less stressful. I had always kept it in mind before but it wasn't until I went through this course that it really clicked how important this concept is.

I've only ever built a website for mobile when I was doing my portfolio and it was done in a completely different way. I can say that using breakpoints and media queries the way we learned to use them in class is much better. I used to view using media queries as some complicated concept, but taking the time to sit down and learn how to use them gave me clarity.

What I enjoyed the most about this course was learning how to use Bootstrap. I can't help but always compare how I used to be a few years ago. When I heard someone talk about Bootstrap it sounded like something that would be difficult to learn and understand. I still have a lot more to learn about it but I enjoyed what I did get to know and implement in my website.

IFSC-3342 taught me the importance of building websites that are accessible and user friendly to everyone no matter what device they are using. I will carry this knowledge and these concepts learned and apply to future projects.
